

Backup - are you prepared?

The need for backup

In today's increasingly digital world, data is proliferating at an unprecedented rate. Important data such as digital photographs, documents and your personal settings are valuable and often irreplaceable and our increasing reliance on digital communication and storage means that data loss can have a serious impact on the running of your business or household.

The need for backup is very real but has been avoided by many people due to the lack of an affordable and easy to use backup product.

net-runna ReStor addresses these issues with fast, flexible and efficient automatic data backup software. *ReStor* offers powerful features at an entry level price.

An easy to set up solution

A wizard takes the user through a simple set-up procedure and by default the important data areas on your computer are selected for backup.

Schedule your backups

ReStor's built in scheduler allows you to automate regular backup operations repeating your backups in the background so you don't have to think about them.

Virtually any kind of data can be backed up

ReStor can backup user created files and folders, for example: photographs, documents and email files. System files and the registry can also be selected for backup and can be restored should a problem occur. The user interface is easy to operate and includes a comprehensive help file.

Backups require less space

Data backups are compressed, securely encrypted, and data is not duplicated in the backup location due to Single Instance Storage technology. As a further efficiency *ReStor* breaks backups into small sections and only backs up the section that has changed.

Fast backup and restore

Unlike most backup tools ReStor identifies files that are already correct and in existence and only backs up new or altered files - similarly it is only changed files that are *restored*. This vastly improves backup and restore performance.

Lost or deleted a file or folder?

ReStor's backup browser allows you to select a backup and browse its contents with an explorer style interface. Individual files and folders can then be selected and restored rather than restoring the entire backup.

Accidentally saved changes?

ReStor's advanced backup engine gives you multiple restore points so you can roll back to any earlier version of a file or folder. The find file feature can search all backups for a specific file and then lists each different version of a file so you can choose which version to roll back to.

Built in 'recycle bin'

When a newer file is overwritten by a restore operation the original file is moved into the *ReStor* keep folder, a kind of recycle bin where it can be retrieved if needed.

Maximum security with dual backup locations

ReStor backs up to any disk drive including the local hard disk, additional partitions or disks and removable storage devices. For complete safety and peace of mind when connected to the network users can backup to local and remote locations simultaneously, when away from the network they can continue to run local backups which synchronise with their network backup location when they reconnect to the network. Backups are secure even if a computer is damaged, lost, stolen or formatted!

Backup anytime

ReStor is designed to run in the background and does not cause a noticeable system slowdown when backing up. By operating in the system idle time priority is given to the other processes the user is running so their working environment is not affected even when frequent backups are scheduled.

Compatibility

ReStor is designed for Microsoft Windows 2000 and XP (Home and Professional).

ReStor complements the *net-runna Enterprise* imaging, deployment and recovery tools by replacing user data following a deployment, migration or repair.
